

GRIGORY GRABOVOY
Teachings on Salvation and Harmonious Development
Technologies of Reality management at the Creator's level
Technology of building physical Reality
(4)

In this lecture
on my system of Salvation and harmonious development
I demonstrate the technology of building physical Reality
as the Creator does
from the point of view that Reality
can be first and foremost
that the Creator has laid down
For example there's man nature

and secondly it can be
is that which is reproduced by people for example

Well it can be some phenomena of external reality
so that they also build something
but in this case it is mainly man who builds

so in order to organize control
for example it already turns out to be an investigative part
which is built on a certain level of Consciousness
created by the Creator

there is a rather simple task in terms of control
it's in terms of staged version
so it's the management of what
what was or who was created or what was created
in terms of creation
and the management of those systems that were created
So secondarily you know like cars

So in this situation it is necessary to define
well certain axiomatic positions that are actually axiomatic
which are actually expressions
of quite specific Laws

In many respects these laws are stable
in terms of millions of years of development
and they have the character

of an even more legislatively rigid system
than say the concept of gravity and so on
i.e. they are even more rigid Laws of Reality in my opinion

and they are expressed as follows
in order to get control
means a system reproduced for example by a technical system
as it can be seen from the practice of management

it is necessary first of all
to form an initial impulse
which will give the next development
and this impulse must necessarily
it is necessary to include
the technical system in terms of its manifestation
in the form of for example a thinking component

so the first first task
is to diagnose the technical system
that can be represented or conceptualized
in terms of Thinking
i.e. to put it simply to bring it into consciousness
as an element of thought

so the second task
is to locate that system

so you take
so far you're only defining general positions of principle
what needs to be done
i.e. where should the technical system be laid down
that most closely satisfies the tasks of the individual

i.e. each personality has a different localization
although basically the first generalized levels
are above the right shoulder and above the left shoulder

but above the left shoulder
are dynamic
of the physical shoulder
these are dynamic systems i.e. fast moving
airplanes and rockets and so on machines

static systems are above the right shoulder

That's the generally accepted system

although you can do a reconstruction
and kind of move that image to a different place

Then the next element of system diagnostics
is to identify external
as associative even or contingent factors
on control
because here it makes sense logically even
most importantly
to cover as much information as possible in a broader way

and so it's done after locating the location
archived in the mind
of any technical system
the identification of all its external connections
i.e. the associative principle

the third position is to change the point
practically scanning
so that's when stability is created
i.e. the next area
in relation to the diagnostic system

The fourth part is
the identification of the future position
in relation to the control object
i.e. technical system

and the fifth part is
is the actual identification
the specific technical system
in informational terms
which is already physically manifested in the physical world

so this technical system
it can already be diagnosed
because it is built on the principles
first of all of informational construction
at the level of Thinking

the definition of this thought in space
in relation to the physical body
stability of this thought
through different points of view
and hence the predictive phase which includes future events

as soon as you formalized
well you've built a sphere
inside of which is a possible technical
and then you just put it inside it
and that's it
and you can immediately see the diagnostics
manifested on the physical level of the technical system

It follows therefore
any diagnostics is realized through
first of all organization

which is what the Creator does
He first organizes
a certain necessary system
from the point of view of the tasks of personal development

i.e. organization on the thinking plane

then the creation of external Reality
after the organization of the object
i.e. the external organization around is created

creation of stability of change of control positions
there are different control points
and then the status of future events Yes

it's quite logically clear
the status of future events is given
A future faction is created
and then the physical object itself is created

hence
it can be created
either by people working and making it
or materialized

So this principle that I've explained
it's also the principle of materialization
So you can materialize a circuit board if an airplane goes down
there's a board missing and something else and something else
I mean you can create in certain situations
material bodies

So in order to do that as I explained
to realize these five principles

in the future after the realization of such a platform
it is possible to diagnose there super complex simple
any system in general

but as a rule any complex system
it is diagnosed if possible
with reliance on some element of the system itself
or the nearest similarly technically manifested element

the principle of uniformity in diagnostics and in management

so by establishing such a legislative system
actually including from practice
it is possible to consider the principle of information organization
from the point of view of well actually an inverse task

how in many ways it is inverse
it is possible to build one's development
if we take into account that technical systems
are developing quite rapidly
including in many functions
they begin to exceed for example the capabilities of the Creator

I mean when the Creator created human beings
He created them
but they can't reach the Creator

If we go by the same principle for example
then how then
to build a strategy for the development of civilization for example
when it is clear that increasingly complex technical systems
can and already do affect the fact
that a car can hit a person etc
not to mention nuclear weapons

the principle of this system
is that
and this is something that you have to be aware of
when it comes to controlling
through any technical system
that every cell means like a physical cell
every state including the spiritual state
if you visualize them as fields of information
like a cell or like a spiritual state

all human systems must be

in terms of your organization of your Consciousness
well actually equidistant
from the reproduction of technical systems

i.e. it's a kind of sphere
in the center of which are
like all your cells are there
all your tasks along the event lines
including your spiritual state

and all the external technical systems
in the organization of your consciousness
right on the distance
they must be
always at the same distance

and then when you get on an airplane for example you get on a car
as soon as you see a certain technical system
starts approaching the center of this sphere
look either at the road or slow down

Well simply put it's a control system
that doesn't allow the technical system
to create problems on the way
actually on the tasks of the eternal development
of the human organism simply put of the personality

so that's why if for example if we set
the task of multidimensionality of space and time
the Creator is in the same position

The more a person develops
the more fixed this distance becomes
the more he invests for example in the task of control

and so no matter how much a man develops
he still can't get closer
and reach the Creator

if we talk about a system like the one
that I'm talking about
this problem can be solved immediately
by means of inverse transformations

For example I have in my tasks
as well as the eternal reproduction of technology

the challenge is to ensure that technology does not under any circumstances
not to destroy human beings

and there I have specific even technical developments
that allow the same technical devices
as soon as according to the parameters of movement
a certain biological type of information appears
a tree or a person
they work in terms of almost like teleportation
to already stable systems parking lots and so on

and these systems are quite real
in terms of mathematical calculations
and there have even been practical experiments in Novosibirsk

there are systems built on the same principle
that can move
and at the same time do not break
for example the system of the existing physical plane
they seem to fall into another space
In teleportation these spaces exist

if it's based on optical systems how it's built
Each level for example is physical
there is a table let's say a wall etc A person
he has well like an hourglass
a certain center of display
according to the principle of similarity
the way my crystal systems are built

and if the space here
well manifested in a more compressed form
then you can take it to another space
and there's just sort of wider streets
and lead from there
and put it in the right place

then this element will not be affected

at the level of physical reality
it's like it's going through a wall
when in reality it seems to have passed
through another property of space

And when you work with control

So when you're working with controlling technical systems
first of all
always pass through at least mentally as it were
or with your inner gaze there on the Spiritual level of diagnostics
all the legislative plans that I have just mentioned

and secondly
try to manage taking into account what has already been achieved
for example in the optical elements of control
which I have there in the form of a patent
here is "Method of preventing catastrophes
and apparatus for its realization"
or "System for transmitting information"
There too the idea goes the same way
by the similarity of crystals
similar crystals transmit identical information

If I concentrate on this crystal in the letter "A"
the same information is immediately read on another similar crystal

There are true
methods of correlation
of the uniqueness of the information
at a given point
of the reader

and when you control technical systems
be sure to incorporate these control principles
lay down
that say
that it's possible to actively control
the existing physical space
but without changing the usual form
for those who for example do not realize these tasks
at this time

once they learn
it will be possible to expand the sphere there
through the same teleportation to build new equipment

although if it is necessary to build supernova equipment
according to those principles according to those tasks
they should be built now
and others will already learn
there is also such a principle in the organization of the Consciousness system

Therefore in the tasks of building and managing technology
be sure to set yourself the task
what the technique should be
in principle from the Creator's point of view
how to manage it
and how to transfer this knowledge to others

I mean what I've said you have to do it
but the new added technologies
that will come
If possible check them out

What I said is that in any case
can be used
and test your techniques as often as possible

but make sure
just as I have shown in the Creator's tasks
taking into account the so-called subtle plans of the Creator's tasks
try to reveal your position

i.e. from the point of view of your position
how the Creator's tasks are manifested
here in a particular place

ie when managing technical systems
be sure to raise this question
Well if possible repeatedly
because nowadays
well there's a tendency
that technical systems
are like reproduction of people only
